No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 11, Application US/09147935A
GENERAL INFORMATION:
APPLICANT: KOOK, Yoon-Hoh
APPLICANT: KIM, Bum-Joon
TITLE OF INVENTION: A METHOD FOR IDENTIFYING MYCOBACTERIAL SPECIES BY
TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF rpoB GENE
FILE REFERENCE: 0136/0F425
CURRENT APPLICATION NUMBER: US/09/147, 935A
CURRENT APPLICATION NUMBER: PCT/KR98/00228
PRIOR APPLICATION NUMBER: PCT/KR98/00228
NUMBER OF SEQ ID NOS: 50
SSEQ ID NO 11
APPLICANT: KIM, Bum-Joon
TITLE OF INVENTION: A METHOD FOR IDENTIFYING MYCOBACTERIAL SPECIES BY
TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF rPOB GENE

US-09-147-935A-15/C

Sequence 15, Application US/09147935A

Patent No. 642584

GENERAL INFORMATION:
APPLICANT: KIOK, YOOO-HOH

TITLE OF INVENTION: A METHOD FOR IDENTIFYING MYCOBACTERIAL SPECIES BY
TITLE OF INVENTION: COMPARATIVE SEQUENCE ANALYSIS OF rpoB GENE
FILE REFERENCE: 0136/0F425

CURRENT APPLICATION NUMBER: US/09/147,935A

CURRENT FILING DATE: 1999-03-19

PRIOR APPLICATION NUMBER: PCT/KR98/00228

PRIOR APPLICATION NUMBER: PCT/KR98/00228

PRIOR ELING DATE: 1998-07-28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 17, Application US/09147935A

                                      The present sequence for Mycobacterium species rpoB gene fragment PCR primer RP03' is used with PCR primer RP05' (AAS05225) to amplify the rpoB gene region from 24 rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments with the unidentified fragment. The rpoB gene fragments are useful to identify a wide range of Mycobacterium species, e.g. for diagnosis or to obtain epidemiological and pathogenesis information for selection of appropriate therapies, including M. tuberculosis, M. leprae and non-tuberculous mycobacteria (MYM) encountered in subjects infected fragments is rapid, precise, simple and cost effective (only 1 PCR required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical cests.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a diagnostic kit for mycobacterial species dentification and drug resistance detection comprising an oligonuclectide chip including a species identification probe, a contrast group probe a mycobacterial drug resistance detection probe, a contrast group probe corresponding to each drug resistance detection probe, and a marker for detecting a hybridisation of the oligonuclectide chip and a specimen. The identification probe is comprised of species-specific DNA sequences of mycobacterial rpoB gene and the detection probe is comprised of one or more modified codons of mycobacterial rpoB gene. The method involves amplifying rpoB gene fragments of specimen by Polymerase Chain Reaction C PCR) and discriminating species by fluorescent intensity corresponding to a particular species. The specimen is preferably uncultured sputum, blood or cerebrospinal fillid of a patient. Sequences AAS99478-AAS99569

This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerse) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 165 RNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                    This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for subunit of RNA polymersel from mycobacterial species provides an sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymersel) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 165 RNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidiues or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                          New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species

This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerse) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16s TRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifempin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerase) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to phylogenetic analysis, the rpoB gene can be used as an alternative to conserved trnoughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit to R RNA polymerses) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RpoB gene; mycobacteria; phylogenetic tree construction;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerse) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 165 RNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.

Kim B,

DEXTENS ON THE PROPERTY OF THE

```
This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerse) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an atternative to phylogenetic analysis, the rpoB gene can be used as an atternative to conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                           New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New pair of polymerase chain reaction (PCR) primers - for sequence-specific amplification of the rpoB gene from mycobacterial species, useful for detecting and identifying mycobacterial species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RpoB gene; mycobacteria; phylogenetic tree construction; mycobacterial species identification; phylogenetic analysis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerse) from mycobacterial species provides an efflicient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S TRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence specific amplification of the rpoB gene (encoding the beta subunit of RNA polymerse) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 165 rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a mycobacterial rpoB gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpoB gene (encoding the beta subunit to RNA polymerses) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpoB gene can be used as an alternative to the 16S rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a mycobacterial rpob gene fragment, that is amplified using the PCR primers of the invention. The primers form a method of detecting and identifying mycobacterial species by constructing a phylogenetic tree for the species. The use of the primers for sequence-specific amplification of the rpob gene (encoding the beta subunit to f RNA polymerse) from mycobacterial species provides an efficient way of characterising these species. In addition to phylogenetic analysis, the rpob gene can be used as an alternative to the 16S rRNA gene because it has four subunits, which are highly conserved throughout prokaryotes. The method is particularly useful for slow growing, fastidious or uncultivatable mycobacteria. Also, rifampin susceptibility can be simultaneously determined in M. tuberculosis.

world. Half of the world population especially those inhabiting highly populated areas of the humid tropics and subtropics, rely on rice as their primary source of carbohydrate. Monocctyledonous rice is a diploid plant (2n-24) with a haploid genome equivalent of 431 Mbp (Arumaganathan and Earle, 1991). The relatively small genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library contains 36.864 clones with an average insert size of 128.5 Kb providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Metazoa, Arthropoda; Hexapoda; Insecta; Pterygota;
